

LaunchFoundry — Project Goals

Project Name

LaunchFoundry

Working One-Liner

LaunchFoundry turns a website, project folder, or local business asset folder into a ready-to-render marketing campaign.

Core Idea

LaunchFoundry is a local-first marketing campaign generator.

The user gives it:

- a project or business idea
- a website or project folder
- photos, screenshots, videos, logos, and notes
- a target platform
- a campaign goal

LaunchFoundry should help produce:

- audience strategy
- platform-specific marketing angles
- campaign concepts
- scripts
- storyboards
- asset recommendations
- Remotion-ready render specs
- captions
- post copy
- hashtags
- QA notes
- next marketing actions

The first test case is:

18th Century Woodworking Services → Facebook Reels / local homeowner campaign

Why This Exists

I build a lot of useful projects, tools, websites, and media systems.

The problem is not only building them.

The problem is getting them seen.

I need a system that can look at a project and its assets, understand what is being sold or promoted, figure out the audience, and create marketing materials that fit the platform.

This should help market:

- small business websites
 - local services
 - portfolio projects
 - SaaS/product prototypes
 - podcast/media projects
 - tools like CUTROOM, Crop Check, StrictSub, GuestFlow, and QuoteCheck Home
-

Main Goal

Build a practical local dashboard that answers:

“Given this project and these assets, what should I post, what should it look like, and how do I render it?”

The system should produce a usable campaign package, not vague marketing advice.

MVP Scope

The MVP should be local-first and browser-first.

Use:

- React
- Vite
- TypeScript
- localStorage
- mock data first
- no backend

- no user accounts
- no billing
- no automatic posting
- no paid APIs

The app should feel like a production dashboard, not a generic todo app.

First MVP Test Case

Business

18th Century Woodworking Services

Target Platform

Facebook Reels

Target Audience

- older homeowners
- local homeowners
- historic-home owners
- people renovating older homes
- people who value craftsmanship
- people who may want to restore woodwork instead of replacing it

Marketing Direction

The campaign should feel:

- trustworthy
- local
- practical
- skilled
- traditional
- careful
- not hypey
- not meme-based
- not Gen Z trend-first

First Campaign Concepts

Generate and compare 3 reel ideas:

1. Restore, Don't Replace

2. Hook: "Before you rip out original woodwork, look at what can be restored."

3. Old Homes Deserve Better Than Builder-Grade Fixes

4. Hook: "Older homes were built with character. Repairs should respect that."

5. Small Details Make the Whole Room Feel Right

6. Hook: "Trim, doors, mantels, and built-ins are the details people notice."

Product Philosophy

LaunchFoundry should not try to magically do everything.

It should help a human make better marketing decisions faster.

The user should still review:

- strategy
- scripts
- captions
- claims
- asset choices
- final renders
- posting decisions

The goal is not full automation.

The goal is:

AI-assisted campaign planning and render preparation.

What LaunchFoundry Should Do

1. Read the Project

LaunchFoundry should understand:

- project name
- business name
- website URL
- offer
- product/service category
- target customer
- brand tone
- colors
- fonts
- proof points
- differentiators
- claims to avoid
- available media assets

2. Scan the Assets

LaunchFoundry should review the available assets and identify:

- photos
- videos
- screenshots
- logos
- documents
- notes
- best opening visuals
- best proof visuals
- best CTA/end-card visuals
- weak assets
- missing assets

3. Pick a Platform Strategy

LaunchFoundry should not treat every platform the same.

A Facebook Reel for a local woodworking service should not feel like a TikTok trend post.

The app should eventually support:

- Facebook Reels

- Instagram Reels
- YouTube Shorts
- LinkedIn posts
- Facebook posts
- carousels
- landing page hero copy
- email campaigns

For MVP, focus on **Facebook Reels**.

4. Generate Campaign Concepts

Each concept should include:

- title
- target audience
- marketing angle
- hook
- promise
- format
- duration
- recommended assets
- missing assets
- why it could work
- why it might fail
- score

5. Build a Storyboard

For each selected concept, create a clear scene-by-scene plan:

- timestamp
- visual
- selected asset
- text overlay
- optional voiceover
- motion notes
- CTA placement

The storyboard should be practical enough to render.

6. Create a Render Spec

LaunchFoundry should output structured JSON that a Remotion project can read.

The render spec should include:

- platform
- aspect ratio
- width
- height
- duration
- scenes
- asset IDs
- layouts
- text overlays
- motion presets
- captions
- export filename

This is the bridge between marketing strategy and actual video rendering.

7. Create a Publishing Pack

For each campaign concept, output:

- caption
- CTA
- hashtags
- first comment
- alt text
- local group post version
- suggested posting note
- follow-up ideas

8. Run QA

Before rendering or posting, LaunchFoundry should check:

- claim risk
 - readability
 - platform fit
 - aspect ratio
 - asset quality
 - missing assets
 - CTA clarity
 - brand consistency
 - overhyped copy
 - unsupported claims
 - whether it is ready to render
-

What Not To Build Yet

Do not build these in the first version:

- user accounts
- billing
- team permissions
- social media API posting
- Facebook page creation
- Instagram auto-posting
- TikTok auto-posting
- LinkedIn scraping
- automatic ad buying
- complex analytics
- real AI API integration
- cloud rendering
- Remotion rendering inside the app

The first version should be a dashboard and campaign-spec generator.

Long-Term Vision

LaunchFoundry could eventually become a local marketing OS for small projects and small businesses.

Future modules could include:

Render Adapter

Turns render specs into videos using:

- Remotion
- FFmpeg
- Motion Canvas
- Shotstack
- other render engines

Project Folder Scanner

Reads real local folders and extracts:

- images
- video files
- logos
- screenshots

- markdown notes
- website files
- brand data

Prompt Pipeline

Runs structured prompt steps:

1. Brand Reader
2. Asset Scanner
3. Audience Strategist
4. Platform Strategist
5. Campaign Concept Generator
6. Storyboard Writer
7. Render Spec Writer
8. Publishing Pack Writer
9. QA Checker

Multi-Project Marketing

Use the same system to market:

- 18th Century Woodworking
- CUTROOM
- Crop Check
- StrictSub
- GuestFlow
- QuoteCheck Home
- Jacob Britten portfolio
- High Functioning-related tools

LinkedIn / Networking Support

Not scraping LinkedIn.

Instead, use exported connections, screenshots, and manual inputs to help write:

- project posts
 - networking messages
 - collaboration pitches
 - job outreach messages
-

Success Criteria for MVP

The MVP is successful when:

1. The app runs locally.
 2. The user can open a dashboard for 18th Century Woodworking.
 3. The app shows a mock project scan.
 4. The app shows an editable brand profile.
 5. The app shows a Facebook-specific audience/platform strategy.
 6. The app generates 3 campaign concepts.
 7. The user can select one campaign concept.
 8. The app shows a clear storyboard.
 9. The app outputs valid Remotion-style render spec JSON.
 10. The app outputs a publishing pack.
 11. The app outputs a QA report.
 12. The user can copy/download the render spec.
 13. The app persists changes locally.
 14. The dashboard feels like a real production tool.
 15. The output is useful enough to create one test Facebook Reel.
-

Immediate Next Steps

Phase 1 — Make the Scaffold Usable

- Run the app locally.
- Fix any TypeScript or build errors.
- Make sure all pages load.
- Make the mock data feel realistic.
- Make the UI readable and clean.
- Make sure localStorage works.
- Make sure render spec export works.

Phase 2 — Connect Prompt Workflow

Create prompt files for:

- brand reader
- asset scanner
- audience strategy
- platform strategy
- campaign concepts
- storyboard
- render spec
- publishing pack

- QA checker

The prompts should be usable with Claude Code / Claude Cowork.

Phase 3 — Test With Dad's Website

Use the real 18th Century Woodworking site/assets.

Test whether LaunchFoundry can generate:

- 3 Facebook Reel ideas
- a storyboard
- a render spec
- captions/post copy
- a QA checklist

Phase 4 — Connect to Remotion

Create a simple Remotion template that can read the exported render spec JSON.

The first render target:

- 9:16 Facebook Reel
- 30 seconds
- image/video slideshow
- text overlays
- logo end card
- simple motion presets

Phase 5 — Reuse on Another Project

After the woodworking test works, run the same process on:

- CUTROOM
- Crop Check
- GuestFlow
- StrictSub
- Jacob Britten portfolio

This proves LaunchFoundry is not just a one-off woodworking campaign tool.

Key Rule

Do not overbuild.

The first version should answer one question well:

“What should we make, using the assets we already have, and how should it be rendered and posted?”

Everything else is later.
